No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosts of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP receptors or tirger NHP new polaries of a characteristic of the polynucleotide constructs encoding NHP products are used to genetically engineer host cells allow for the identification of compounds that bind to NHP receptors or tirger NHP new polaries of a product and the products and the products are used to genetically engineer host cells allow for the identification of compounds that bind to NHP receptors or tirger NHP new polaries are used to the products and the products and the products are used to genetically engineer the products are used to genetically expression the products are used to genetically engineer the products are used to genetically engineer the products are used to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a novel human protein (NHP) containing a CUB bottomain (an extraccllular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy

                                                                                                                                                                                                    as hybridisation probes for screening libraries and assessing quene patterns. NIP nucleotide sequences are useful for detecting mutant or inappropriately expressed NIPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal munction of NIP in the body. Nucleotide constructs encoding NIP products are used to genetically engineer host cells to express such products in vito. These host cells allow for the identification of compounds that bind to NIP receptors or trigger NIP-mediated pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP pilgonucleotides are useful
                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 5;

Claim 8; Fig 1; 263pp; English

The sequence represents human TANGO 229 polypeptide. This protein and can be similar others exhibit the ability to affect growth, proliferation, curvival, differentiation, activity, morphology, or movement/migration of, e.g. T cells and cells of the heart, liver, pancreas, placenta, compared to the lateral muscle, kidney, spleen, lymph node, peripheral compared to the proteins of the heart, liver, pancreas, placenta, combinating agents for regulating ealural processes, thus, the proteins can deliver associated nucleic acids can be used to promosticate, prevent, compared to the proteins of the protein of the proteins of the protein

```
Of the sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with crequiating development, modulating cellular processes and preventing CC infectious disease. NHP nucleotide sequences are useful for gene therapy CC of physiological disorders or diseases. NHP oligonucleotides are useful CC as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or impropriately expressed NHBs (for example, those proteins associated CC impropriately expressed NHBs (for example, those proteins associated CC with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic CC or phenotypic manifestations of perturbing the normal function of NHP in CC genetically engineer host cells to express such products are used to constructs encoding NHP products are used to be constructs encoding NHP products are used to constructs encoding NHP products are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; Page 26; 33pp; English

             The present sequence represents a polypeptide sequence which is isolated from lymph node stromal cells of fan /- mice. The polynucleotides and their polypeptides are useful for treating an inflammatory disorder, disorder of immune system and cancer selected from epithelial, lymphoid, myeloid, stromal and neuronal cancers, a viral disorder, in particular HIV infection and for modulating the growth of blood vessels. The polypeptides are useful for treating a tumour necrosis factor (TMF) mediated disorder, such as those selected from arthritis, inflammatory bowel disease and cardiac failure and a libroblast growth factor-mediated disorder. It is also useful in assays to determine biological activity, to raise antibodies, to isolate corresponding ligads or receptors, to quantify levels of protein or

```
expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Add37196 to make the present sequences used in the exemplification of the research terrories.
                                                                                                                                                                                                                                                                                                                                         cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene thorapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P

                                                                                                                                                                                                                                                                                                                                                                                                                                                a coaquiation cofactor which is selectively expressed in hammatopoletic, heart and reproductive tissues. It has hammatatic and cerebroprotective activities. The FBH contains a Factor 5/8 signature and is useful as a therapeutic for treating coaquiation related diseases such as haemophilia and stroke. The nucleic acid is useful as hybridisation probe and amplification primer for detecting deficiencies in the level of FBH mRNA, for screening FBH gene mutations and for monitoring regulation of gene expression. Fragments of the nucleic acid are also useful as diagnostic probes and primers, and can be used in screening methods such as those using DNA chips. The present sequence is also useful as a target to screen therapeutically useful modulators of the FBH.
                                                                                                                                                                                                                                                                                                                                                                                     Sequence

```
The neuropilins are type I transmembrane proteins and act as semaphorin III (Sema III) receptors. The semaphorins have been shown to function in repulsive axon guidance. Sema III is a screted protein that in vitro causes neuronal growth cone collepse and chemorepulsion on neurites and is required in vivo for correct sensory affected tinnervation and other aspects of development. Agents which, inhibit or enhance the interaction of a
                                                                                                                             neuro-regeneration, immune modulation including hypersensitivity and graft-rejection, and diagnosis and treatment of viral and oncological infection/diseases. The neurophilms, neurophilm-encoding nuclaic acids, and unique portions also are useful in screening chemical
                                                                                                                                                                                                                                         growth, immune responsiveness, and viral pathogenesis, and can be used in the treatment and diagnosis of neurological disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              products for the diagnosis and treatment of neurological
immunological, oncological and viral diseases
                                              genetic mapping as probes for related genes, as diagnostic reagents for genetic, neurological, immunological and oncological disease.
                                                                                                                                                                                                                                                                                               semaphorin and a neurophilin can be potent modulators of nerve

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the human secreted proteins ABB64549-B64594. The sequence is a search result from a BLASTX homology search. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosts, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, qastrointestinal tract, liver, lung, or urogenital; (b) immune discreters e.g. Addison's disease, alterists, autoinmune haemolytic aneman, autoimmune thyroiditis, diabetes mellitus, Crobi's disease, multiple sclarosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischemias; (d) wond healing. (a) healing. (a) healing. (a) healing. (a) healing. (b) healing. (c)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
                                                                                                                                                                                                                  The present sequence represents a soluble, truncated form of human neuropilin-2, a novel receptor of vascular endothelial growth factor (VEGF). The soluble neuropilin-2 deviates from the full-length protein (see AAY06318) between the b2 and c domains after amino acid 547, at the position of an exon-exon boundary, and includes 8 extra C-terminal amino acids. Soluble neuropilins are capable of binding to VEGF165 or any form of VEGF that contains exon 7 and are useful for inhibiting VEGF interaction not only with neuropilins but also with KDR/Fik-1 and Fitl. They may also not contains the contains that contains the contains 
                                                                                                                                                           act as dominant negative receptors when expressed in cells by dimerizing with intact neuropilins are useful for tractors. The soluble neuropilins are useful for tractors.

```
CC Semaphorin receptor (SR) proteins are involved in nerve cell cylidance. The SR proteins can regulate cell function and morphology, especially nerve cells. Inhibitors of SR proteins promote nerve cell cyrowth. Binding agents specific to the SR polypeptides are useful CC for diagnosis and therapy, especially where disease or disease. C prognosis is associated with improper or undestrable axon outgrowth cc translation. The SR nuclei, sequences are used to provide c translatable transcripts, hybridisation probes, PCR primers, CC diagnostic nucleic acids, etc. They are used in detecting the presence of SR genes, and to identify wild type and mutant alleles. Within alleles are used to generate allele-specific oligonucleotide within talleles are used to generate allele-specific oligonucleotide composes for clinical diagnosis. The methods are used to identify gapits which modulate the activity of SR polypeptides. This sequence encodes the mouse SRZ(b) (D plypeptide which is an isoform of neuropilin-2b with 0 amino acids inserted.

Inhibitors of SR proteins promote nerve cell growth. Binding agents specific to the SR polypeptides are useful for diagnosis and therapy, especially where disease or disease corporates is associated with improper or undestrable axon outgrowth or orientation. The SR nucleic acid sequences are used to provide translatable transcripts, hybridisation probes, PGR primers, cidagnostic nucleic acids, etc. They are used in detecting the provide translatable transcripts, hybridisation probes, PGR primers, cidagnostic nucleic acids, etc. They are used in detecting the presence of SR genes, and to identify wild type £nd mutant alleles. Put the second diagnosts. The methods are used to identify agents which modulate the activity of SR polypeptides. This groups for continuous the methods are used to dentify agents which modulate the activity of SR polypeptides. This sequence is the human SR2a(0) 17 polypeptide which is an isoform of sequence is the with 17 amino acids inserted after amino acid 809.

         receptor of vascular endothelial growth factor (VEGP) Expression of neuropilin is associated with anglogenesis and motile metastatic cancer cells, and thus is an important target for antiangiogenic and anticancer therapy. Neuropilin-2 colk (see AAX5912) was obtained from MDA-MB-231 cells by expression cloning soluble neuropilin (see ANX60320) comprising anino acids 277-593 of the present sequence is claimed, and can be isolated from neuropilin producing cells or is recombinantly engineered from neuropilin encoding by. Soluble truncated neuropilins are capable of binding to VEGF165 or any form of VEGF that contains sxo. 7 and are binding to VEGF165 or any form of VEGF that contains sxo. 7 and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neuropilin-2; human; vascular endothelial growth factor receptor; VRGF; inhibitor; metastasis; angiogenesis; infilammation; arthritis diabetic retinopathy; cytostatic; antinflammatory; antiangiogenic; antidiabetic; ophthalmological; antiarthritic.
